

# Precision Low Power FGA Voltage References

## ISL60002

The [ISL60002](#) FGA voltage references are very high precision analog voltage references fabricated in Intersil's proprietary Floating Gate Analog (FGA) technology and feature low supply voltage operation at ultra-low 350nA operating current.

Additionally, the ISL60002 family features guaranteed initial accuracy as low as  $\pm 1.0\text{mV}$  and  $20\text{ppm}/^\circ\text{C}$  temperature coefficient. The initial accuracy and temperature stability performance of the ISL60002 family, plus the low supply voltage and 350nA power consumption, eliminates the need to compromise thermal stability for reduced power consumption, making it an ideal companion to high resolution, low power data conversion systems.

Special Note: Post-assembly x-ray inspection may lead to permanent changes in device output voltage and should be minimized or avoided. For further information, please see ["Applications Information" on page 34](#) and [AN1533](#), "X-Ray Effects on Intersil FGA References".

## Applications

- High resolution A/Ds and D/As
- Digital meters
- Bar code scanners
- Mobile communications
- PDAs and notebooks
- Medical systems

## Features

- Reference voltages . . . . . 1.024V, 1.2V, 1.25V, 1.8V, 2.048V, 2.5V, 2.6V, 3.0V, and 3.3V
- Absolute initial accuracy options . . . . .  $\pm 1.0\text{mV}$ ,  $\pm 2.5\text{mV}$  and  $\pm 5.0\text{mV}$
- Supply voltage range
  - ISL60002-10, -11, -12, -18, -20, -25 . . . . . 2.7V to 5.5V
  - ISL60002-26 . . . . . 2.8V to 5.5V
  - ISL60002-30 . . . . . 3.2V to 5.5V
  - ISL60002-33 . . . . . 3.5V to 5.5V
- Ultra-low supply current. . . . . 350nA typ
- Low  $20\text{ppm}/^\circ\text{C}$  temperature coefficient
- $I_{\text{SOURCE}}$  and  $I_{\text{SINK}} = 7\text{mA}$
- $I_{\text{SOURCE}}$  and  $I_{\text{SINK}} = 20\text{mA}$  for ISL60002-33 only
- ESD protection . . . . . 5.5V (Human Body Model)
- Standard 3 Ld SOT-23 packaging
- Operating temperature range
  - ISL60002-10, -11, -12, -18, -20, -25, -26, -30 . . . . .  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$
  - ISL60002-33 . . . . .  $-40^\circ\text{C}$  to  $+105^\circ\text{C}$
- Pb-free (RoHS compliant)

## NOTES:

- Refer to [TB347](#) for details on reel specifications.
- These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
- For Moisture Sensitivity Level (MSL), see device information page for [ISL60002](#). For more information on MSL see techbrief [TB363](#).
- The part marking is located on the bottom of the part.

# ISL60002

## Absolute Maximum Ratings

Maximum Voltage $V_{IN}$ to GND	-0.5V to +6.5V
Maximum Voltage $V_{OUT}$ to GND (10s)	-0.5V to + $V_{OUT} + 1V$
Voltage on "DNC" Pins	No connections permitted to these pins
ESD Ratings	
Human Body Model	5500V
Machine Model	550V
Charged Device Model	2kV

## Environmental Operating Conditions

X-Ray Exposure (Note 6)	10mRem
-------------------------	--------

## Thermal Information

Thermal Resistance (Typical)	$\theta_{JA}$ (°C/W)	$\theta_{JC}$ (°C/W)
3 Ld SOT-23 (Notes 7, 8)	275	110
Continuous Power Dissipation ( $T_A = +85^\circ\text{C}$ )	99mW	
Maximum Junction Temperature (Plastic Package)	+107°C	
Storage Temperature Range	-65°C to +150°C	
Pb-Free Reflow Profile	see <a href="#">TB493</a>	

## Recommended Operating Conditions

Temperature Range	
Industrial	-40°C to +85°C
3.3V Version	-40°C to +105°C

**CAUTION:** Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

### NOTES:

- Measured with no filtering, distance of 10" from source, intensity set to 55kV and 70mA current, 30s duration. Other exposure levels should be analyzed for Output Voltage drift effects. See ["Applications Information" on page 34](#).
- $\theta_{JA}$  is measured with the component mounted on a high-effective thermal conductivity test board in free air. See Tech Brief [TB379](#) for details.
- For  $\theta_{JC}$ , the "case temp" location is taken at the package top center.
- Post-reflow drift for the ISL60002 devices will range from 100 $\mu\text{V}$  to 1.0mV based on experimental results with devices on FR4 double-sided boards. The design engineer must take this into account when considering the reference voltage after assembly.
- Post-assembly X-ray inspection may also lead to permanent changes in device output voltage and should be minimized or avoided. Initial accuracy can change 10mV or more under extreme radiation. Most inspection equipment will not affect the FGA reference voltage, but if X-ray inspection is required, it is advisable to monitor the reference output voltage to verify excessive shift has not occurred.

**Electrical Specifications ISL60002-10,  $V_{OUT} = 1.024V$**  (Additional specifications on [page 9](#), "Common Electrical Specifications"). ### NOTES:

- Compliance to datasheet limits is assured by one or more methods: production test, characterization, and/or design.
- Across the specified temperature range. Temperature coefficient is measured by the box method whereby the change in  $V_{OUT}$  is divided by the temperature range:  $(-40^\circ C$  to  $+85^\circ C = +125^\circ C$ , or  $-40^\circ C$  to  $+105^\circ C = +145^\circ C$  for the ISL60002-33).
- Thermal hysteresis is the change in  $V_{OUT}$  measured at  $T_A = +25^\circ C$  after temperature cycling over a specified range,  $\Delta T_A$ .  $V_{OUT}$  is read initially at  $T_A = +25^\circ C$  for the device under test. The device is temperature cycled and a second  $V_{OUT}$  measurement is taken at  $+25^\circ C$ . The difference between the initial  $V_{OUT}$  reading and the second  $V_{OUT}$  reading is then expressed in ppm. For  $\Delta T_A = +125^\circ C$ , the device under test is cycled from  $+25^\circ C$  to  $+85^\circ C$  to  $-40^\circ C$  to  $+25^\circ C$ , and for  $\Delta T_A = +145^\circ C$ , the device under test is cycled from  $+25^\circ C$  to  $+105^\circ C$  to  $-40^\circ C$  to  $+25^\circ C$ .
- Long term drift is logarithmic in nature and diminishes over time. Drift after the first 1000 hours will be approximately 10ppm.
- Short-circuit current (to  $V_{CC}$ ) for ISL60002-25 at  $V_{IN} = 5.0V$  and  $+25^\circ C$  is typically around 30mA. Shorting  $V_{OUT}$  to  $V_{CC}$  is not recommended due to risk of resetting the part.

## High Current Application

FIGURE 114. DIFFERENT  $V_{IN}$  AT ROOM TEMPERATURE

FIGURE 115. DIFFERENT  $V_{IN}$  AT HIGH TEMPERATURE

## Applications Information

### FGA Technology

The ISL60002 series of voltage references use the floating gate technology to create references with very low drift and supply current. Essentially, the charge stored on a floating gate cell is set precisely in manufacturing. The reference voltage output itself is a buffered version of the floating gate voltage. The resulting reference device has excellent characteristics, which are unique in the industry: very low temperature drift, high initial accuracy, and almost zero supply current. Also, the reference voltage itself is not limited by voltage bandgaps or zener settings, so a wide range of reference voltages can be programmed (standard voltage settings are provided, but customer-specific voltages are available).

The process used for these reference devices is a floating gate CMOS process, and the amplifier circuitry uses CMOS transistors for amplifier and output transistor circuitry. While providing excellent accuracy, there are limitations in output noise level and load regulation due to the MOS device characteristics. These limitations are addressed with circuit techniques discussed in other sections.

### Nanopower Operation

Reference devices achieve their highest accuracy when powered up continuously, and after initial stabilization has taken place. This drift can be eliminated by leaving the power on continuously.

The ISL60002 is the first high precision voltage reference with ultra low power consumption that makes it possible to leave power on continuously in battery operated circuits. The ISL60002 consumes extremely low supply current due to the proprietary FGA technology. Supply current at room temperature is typically 350nA, which is 1 to 2 orders of magnitude lower than competitive devices. Application circuits using battery power will benefit greatly from having an accurate, stable reference, which essentially presents no load to the battery.

In particular, battery powered data converter circuits that would normally require the entire circuit to be disabled when not in use, can remain powered up between conversions as shown in

[Figure 116](#). Data acquisition circuits providing 12 to 24 bits of accuracy can operate with the reference device continuously biased with no power penalty, providing the highest accuracy and lowest possible long term drift.

Other reference devices consuming higher supply currents will need to be disabled in between conversions to conserve battery capacity. Absolute accuracy will suffer as the device is biased and requires time to settle to its final value, or, may not actually settle to a final value as power on time may be short.

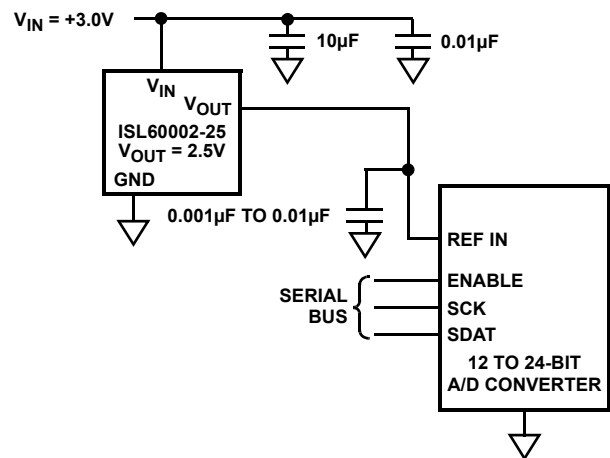

FIGURE 116.

### Board Mounting Considerations

For applications requiring the highest accuracy, board mounting location should be reviewed. Placing the device in areas subject to slight twisting can cause degradation of the accuracy of the reference voltage due to die stresses. It is normally best to place the device near the edge of a board, or the shortest side, as the axis of bending is most limited at that location. Obviously mounting the device on flexprint or extremely thin PC material will likewise cause loss of reference accuracy.

## Board Assembly Considerations

FGA references provide high accuracy and low temperature drift but some PC board assembly precautions are necessary. Normal output voltage shifts of 100 $\mu$ V to 1mV can be expected with Pb-free reflow profiles. Precautions should be taken to avoid excessive heat or extended exposure to high reflow temperatures, which may reduce device initial accuracy.

Post-assembly X-ray inspection may also lead to permanent changes in device output voltage and should be minimized or avoided. If X-ray inspection is required, it is advisable to monitor the reference output voltage to verify excessive shift has not occurred. If large amounts of shift are observed, it is best to add an X-ray shield consisting of thin zinc (300 $\mu$ m) sheeting to allow clear imaging, yet block X-ray energy that affects the FGA reference.

## Special Applications Considerations

In addition to post-assembly examination, there are also other X-ray sources that may affect the FGA reference long term accuracy. Airport screening machines contain X-rays and will have a cumulative effect on the voltage reference output accuracy. Carry-on luggage screening uses low level X-rays and is not a major source of output voltage shift, however, if a product is expected to pass through that type of screening over 100 times, it may need to consider shielding with copper or aluminum. Checked luggage X-rays are higher intensity and can cause output voltage shift in much fewer passes, thus devices expected to go through those machines should definitely consider shielding. Note that just two layers of 1/2 ounce copper planes will reduce the received dose by over 90%. The leadframe for the device which is on the bottom also provides similar shielding.

If a device is expected to pass through luggage X-ray machines numerous times, it is advised to mount a 2-layer (minimum) PC board on the top, and along with a ground plane underneath will effectively shield it from 50 to 100 passes through the machine. Since these machines vary in X-ray dose delivered, it is difficult to produce an accurate maximum pass recommendation.

## Noise Performance and Reduction

The output noise voltage in a 0.1Hz to 10Hz bandwidth is typically 30 $\mu$ V<sub>P-P</sub>. This is shown in the plot in the Typical Performance Curves. The noise measurement is made with a bandpass filter made of a 1-pole high-pass filter with a corner frequency at 0.1Hz and a 2-pole low-pass filter with a corner frequency at 12.6Hz to create a filter with a 9.9Hz bandwidth. Noise in the 10kHz to 1MHz bandwidth is approximately

400 $\mu$ V<sub>P-P</sub> with no capacitance on the output, as shown in [Figure 117](#). These noise measurements are made with a 2 decade bandpass filter made of a 1-pole high-pass filter with a corner frequency at 1/10 of the center frequency and 1-pole low-pass filter with a corner frequency at 10 times the center frequency. [Figure 117](#) also shows the noise in the 10kHz to 1MHz band can be reduced to about 50 $\mu$ V<sub>P-P</sub> using a 0.001 $\mu$ F capacitor on the output. Noise in the 1kHz to 100kHz band can be further reduced using a 0.1 $\mu$ F capacitor on the output, but noise in the 1Hz to 100Hz band increases due to instability of the very low power amplifier with a 0.1 $\mu$ F capacitance load. For load capacitances above 0.001 $\mu$ F the noise reduction network shown in [Figure 118](#) is recommended. This network reduces noise significantly over the full bandwidth. As shown in [Figure 117](#), noise is reduced to less than 40 $\mu$ V<sub>P-P</sub> from 1Hz to 1MHz using this network with a 0.01 $\mu$ F capacitor and a 2k $\Omega$  resistor in series with a 10 $\mu$ F capacitor.

FIGURE 117. NOISE REDUCTION

FIGURE 118. NOISE REDUCTION NETWORK

## Turn-On Time

The ISL60002 devices have ultra-low supply current and thus the time to bias up internal circuitry to final values will be longer than with higher power references. Normal turn-on time is typically 7ms. This is shown in [Figure 119](#). Since devices can vary in supply current down to >300nA, turn-on time can last up to about 12ms. Care should be taken in system design to include this delay before measurements or conversions are started.

FIGURE 119. TURN-ON TIME

## Temperature Coefficient

The limits stated for temperature coefficient (tempco) are governed by the method of measurement. The overwhelming standard for specifying the temperature drift of a reference is to measure the reference voltage at two temperatures, take the total variation,  $(V_{HIGH} - V_{LOW})$ , and divide by the temperature extremes of measurement  $(T_{HIGH} - T_{LOW})$ . The result is divided by the nominal reference voltage (at  $T = +25^{\circ}\text{C}$ ) and multiplied by  $10^6$  to yield ppm/ $^{\circ}\text{C}$ . This is the “Box” method for specifying temperature coefficient.

DATE	REVISION	CHANGE
November 17, 2016	FN8082.21	Updated Related Literature on page 1 to new standard. Updated Ordering Information table - added Tape and Real quantity column.
January 8, 2015	FN8082.20	-Updated ordering information table on page 3 by removing withdrawn part numbers: ISL60002BIH320Z, ISL60002BIH325Z, ISL60002CIH320Z, ISL60002DAH333Z. - Changed the y-axis units on Figure 55, on page 21 from 5mV/DIV to 5µV/DIV. Added revision history and about Intersil verbiage. Updated POD from P3.064 to P3.064A. Changes are as follows: Detail A changes: 0.085 - 0.19 to 0.13 ±0.05 Removed 0.25 above Gauge Plane 0.38±0.10 to 0.31 ±0.10 Side View changes: 0.95±0.07 to 0.91 ±0.03

## About Intersil

Intersil Corporation is a leading provider of innovative power management and precision analog solutions. The company's products address some of the largest markets within the industrial and infrastructure, mobile computing, and high-end consumer markets.

For the most updated datasheet, application notes, related documentation and related parts, see the respective product information page found at [www.intersil.com](http://www.intersil.com).

You may report errors or suggestions for improving this datasheet by visiting [www.intersil.com/ask](http://www.intersil.com/ask).

Reliability reports are also available from our website at [www.intersil.com/support](http://www.intersil.com/support).

For additional products, see [www.intersil.com/en/products.html](http://www.intersil.com/en/products.html)

Intersil products are manufactured, assembled and tested utilizing ISO9001 quality systems as noted in the quality certifications found at [www.intersil.com/en/support/qualandreliability.html](http://www.intersil.com/en/support/qualandreliability.html)

*Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.*

For information regarding Intersil Corporation and its products, see [www.intersil.com](http://www.intersil.com)

### NOTES:

1. Dimensions are in millimeters.  
Dimensions in ( ) for Reference Only.
2. Dimensioning and tolerancing conform to ASME Y14.5M-1994.
3. Reference JEDEC TO-236.
4. Dimension does not include interlead flash or protrusions.  
Interlead flash or protrusions shall not exceed 0.25mm per side.
5. Footlength is measured at reference to gauge plane.
